[DOC] Numerical Linear Algebra Trefethen Bau Solution Manual

This course builds on elementary linear algebra and in it we derive, describe and analyse a number of widely used constructive methods (algorithms) for various problems involving matrices. Numerical Methods for solving linear systems of equations, computing eigenvalues and singular values and various related problems involving matrices are the main focus of this course.

This course concerns the numerical solution of linear systems, linear least squares problems (best approximate solution for an inconsistent linear system), eigenvalue and singular value problems. We will introduce numerical algorithms for the solution of these problems on a computer, and analyze their efficiency and accuracy in the presence of rounding errors.

Read "Lectures 7, 8, 16, 18, and 19" in the textbook Numerical Linear Algebra. It turns out that modified GS is backwards stable in the sense that the product QR is close to A , i.e. the function $f(A) = QR$ is backwards stable in MGS; this is why solving systems with Q, R (appropriately used as discussed in Trefethen Lecture 19) is an ...
